

# Injektion-intern

## New: MC-Fastpack 2033

The **MC-Fastpack 2033** is added to the product range of the **MC-Fastpack System** and is now available.

The elastomer resin reacts rapidly with water and foams up with high volume increase. The foam stops pressurised water. Very effective as a temporary measure. Attention: A sealing second injection with MC-elastomer resins require more pressure. A quick change of the resins in the MC-Fastpack Power-Tool is important.

**MC-Fastpack 2033** It can be injected over MC-Hammerpacker LP in cracks  $\geq 0.5$  mm for temporary sealing. An appropriate crack contact by the bore holes are required.

The **MC-Fastpack 2033** can be processed easily and safely with the MC-Fastpack Power-Tool . Time-consuming steps such as pre-mixing of the individual components and the subsequent cleaning of the injection pump are no longer necessary due to the **MC-Fastpack technology**. The ease of handling accelerates the entire injection process.

### Areas of Application:

- Sealing of heavy water-bearing cracks before secondary sealing with MC-Elastomer resins or permanent caulking system
- Stops water leakage
- Filling of voids
- REACh-assessed exposure: permanent water contact (crack), periodical inhalation, application
